INHALATION KIT COMPRISING INHALABLE POWDER OF TIOTROPIUM

5. With regard to the abstract,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the drawings to be published with the abstract is Figure No.

☒ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

1
☐ None of the figures.

INHALATION KIT COMPRISING INHALABLE POWDER OF TIOTROPIUM

The invention relates to a method for the administration of powdered preparations containing tiotropium by inhalation.

5

Background to the invention

Tiotropium bromide is known from European Patent Application EP 418 716 A1 and has the following chemical structure:

10

Tiotropium bromide is a highly effective anticholinergic with a long-lasting activity which can be used to treat respiratory complaints, particularly COPD (chronic obstructive pulmonary disease) and asthma. The term tiotropium refers to the free ammonium cation.

15

For treating the abovementioned complaints, it is useful to administer the active substance by inhalation. In addition to the administration of broncholytically active compounds in the form of metered aerosols and inhalable solutions, the use of inhalable powders containing active substance is of particular importance.

20

With active substances which have a particularly high efficacy, only small amounts of the active substance are needed per single dose to achieve the desired therapeutic effect. In such cases, the active substance has to be diluted with suitable excipients in order to prepare the inhalable powder. Because of the large amount of excipient, the properties of the inhalable powder are critically influenced by the choice of excipient. When choosing the excipient its particle size is particularly important. As a rule, the finer the excipient, the poorer its flow properties. However, good flow properties are a prerequisite for highly accurate metering when packing and dividing up the individual doses of preparation, e.g. when producing capsules for powder inhalation or when the patient is metering the individual dose before using a multi-dose inhaler. It has also been found that the particle size of the excipient has a considerable influence on the proportion of active substance in the inhalable powder

25

30

which is delivered for inhalation. The term Inhalable proportion of active substance refers to the particles of the inhalable powder which are conveyed deep into the branches of the lungs when inhaled with a breath. The particle size required for this is between 1 and 10 μm , preferably less than 5 μm .

5

Finally, it has been found that the intended therapeutic effect upon the administration of a pharmaceutical composition via inhalation can be decisively influenced by the inhalation device.

10 Accordingly, the aim of the invention is to provide for a therapeutically efficient method for the administration of inhalable powders containing tiotropium. Another object of the invention is to provide for an inhalation kit comprising a tiotropium containing powder and an inhalation device, said kit being applicable in the method for administration mentioned before.

15

Detailed description of the invention

In the method according to the invention an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient is administered.

20

Of particular interest for the method according to the invention is an inhalable powder containing 0.01 to 2 %, preferably 0.04 to 0.8 %, more preferably 0.08 to 0.64 % tiotropium in admixture with a physiologically acceptable excipient is administered.

25 More preferably in the method according to the invention an inhalable powder containing 0.1 to 0.4 % tiotropium in admixture with a physiologically acceptable excipient is administered.

By tiotropium is meant the free ammonium cation. The counter-ion (anion) may be chloride, bromide, iodide, methanesulphonate, para-toluenesulphonate or methyl sulphate. Of these anions, the bromide is preferred.

30

Accordingly, the method according to the present invention preferably relates to inhalable powders which contain tiotropium in form of tiotropium bromide in an amount of 0.0012 to 6.02 %, in admixture with a physiologically acceptable excipient.

35 Of particular interest for the method according to the invention is an inhalable powder containing 0.012 to 2.41 %, preferably 0.048 to 0.96 %, more preferably 0.096 to 0.77 % tiotropium bromide in admixture with a physiologically acceptable excipient is administered.

More preferably in the method according to the invention an inhalable powder containing 0.12 to 0.48 % tiotropium bromide in admixture with a physiologically acceptable excipient is administered.

- 5 Tiotropium bromide is, depending on the choice of reaction conditions and solvents, obtainable in different crystalline modifications. Most preferred according to the invention are those powder preparations, that contain tiotropium in form of the crystalline tiotropium bromide monohydrate. Accordingly, the powdered preparations obtainable according to the invention preferably contain 0.0012 to 6.25 % crystalline
10 tiotropium bromide monohydrate in admixture with a physiologically acceptable excipient is administered. Of particular interest for the method according to the invention is an inhalable powder containing 0.0125 to 2.5 %, preferably 0.05 to 1 %, more preferably 0.1 to 0.8 % crystalline tiotropium bromide monohydrate in admixture with a physiologically acceptable excipient is administered.
- 15 More preferably in the method according to the invention an inhalable powder containing 0.12 to 0.5 % crystalline tiotropium bromide monohydrate in admixture with a physiologically acceptable excipient is administered.

- Examples of physiologically acceptable excipients which may be used to prepare the
20 inhalable powders applicable according to the invention include, for example, monosaccharides (e.g. glucose or arabinose), disaccharides (e.g. lactose, saccharose, maltose), oligo- and polysaccharides (e.g. dextrane), polyalcohols (e.g. sorbitol, mannitol, xylitol), salts (e.g. sodium chloride, calcium carbonate) or mixtures of these excipients with one another. Preferably, mono- or disaccharides are used,
25 while the use of lactose or glucose is preferred, particularly, but not exclusively, in the form of their hydrates, preferably in the form of their monohydrates.

- In the method according to the invention the average particle size of the physiologically acceptable excipient is preferably between 10 to 500 μm , more
30 preferably between 15 to 200 μm , most preferably between 20 to 100 μm . If not otherwise emphasised the term average particle size according to the invention is to be understood as the Mass Median Aerodynamic Diameter (MMAD). Methods for the determination thereof are known in the art.

- Besides the coarser particle fraction of the excipient mentioned hereinbefore, the
35 excipient can optionally additionally contain a specifically added fraction of excipient of finer particle size. This finer particle size fraction is characterized by an average particle size of 1 to 9 μm , preferably 2 to 8 μm , more preferably 3 to 7 μm . If a finer particle fraction is present the proportion of finer excipient in the total amount of excipient is 1 to 20 %, preferably 3 to 15%, more preferably 5 to 10%.

When reference is made to a mixture within the scope of the present invention, this always means a mixture obtained by mixing together clearly defined components. Accordingly, when an excipient mixture of coarser and finer excipients is mentioned, this can only denote mixtures obtained by mixing a coarser excipient component with
5 a finer excipient component.

The percentages given within the scope of the present invention are always percent by weight.

10 In the method according to the invention the inhalable powders mentioned hereinbefore may efficiently be administered using inhalers that are characterized by a specific flow resistance (R).

The flow resistance of Inhalers can be calculated via the following formula:

15

$$v = \frac{1}{R} \cdot \sqrt{p}$$

wherein v is the volumetric flow rate (l/min),

p is the pressure drop (kPa), and

20

R is the flow resistance.

In the method according to the invention the flow resistance R characterising the inhaler is in a range of about 0.01 – 0.1 \sqrt{kPa} min/l preferably in the range of about 0.02 – 0.06 \sqrt{kPa} min/l.

25

Accordingly, the invention relates to a method for the administration of an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , and further characterized in that the said tiotropium containing powder
30 is administered by an Inhaler displaying a flow resistance of about 0.01 – 0.1 \sqrt{kPa} min/l.

In another embodiment, the invention relates to a method for the treatment of airway diseases, particularly COPD (chronic obstructive pulmonary disease) and asthma,
35 characterized in that an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , is administered via inhalation by an Inhaler displaying a flow resistance of about 0.01 – 0.1 \sqrt{kPa} min/l.

In another embodiment the invention relates to the use of an inhaler for the administration of a tiotropium containing inhalable powder via inhalation, characterised in that the inhalable powder contains tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , and further characterized in that the said inhaler displays a flow resistance of about $0.01 - 0.1 \sqrt{kPa} \text{ min/l}$.

In yet another embodiment the invention relates to an inhalation kit consisting of an inhaler displaying a flow resistance of about $0.01 - 0.1 \sqrt{kPa} \text{ min/l}$ and an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm .

In another preferred embodiment according to the invention the inhaler described in Figure 1 is applied. For the administration of tiotropium containing powders by inhalation by means of the inhaler according to figure 1, it is required to fill appropriate amounts of the powder into capsules. Methods for filling powders into capsules are known in the art.

The inhaler according to figure 1 is characterised by a housing 1 containing two windows 2, a deck 3 in which there are air inlet ports and which is provided with a screen 5 secured via a screen housing 4, an inhalation chamber 6 connected to the deck 3 on which there is a push button 9 provided with two sharpened pins 7 and movable counter to a spring 8, a mouthpiece 12 which is connected to the housing 1, the deck 3 and a cover 11 via a spindle 10 to enable it to be flipped open or shut and three holes 13 with diameters below 1 mm in the central region around the capsule chamber 6 and underneath the screen housing 4 and screen 5.

The main air flow enters the inhaler between deck 3 and base 1 near to the hinge.

The deck has in this range a reduced width, which forms the entrance slit for the air.

Then the flow reverses and enters the capsule chamber 6 through the inlet tube. The flow is then further conducted through the filter and filter holder to the mouthpiece. A small portion of the flow enters the device between mouthpiece and deck and flows then between filterholder and deck into the main stream. Due to production tolerances there is some uncertainty in this flow because of the actual width of the slit between filterholder and deck. In case of new or reworked tools the flow resistance of the inhaler may therefore be a little off the target value. To correct this deviation the deck has in the central region around the capsule chamber 6 and underneath the screen housing 4 and screen 5 three holes 13 with diameters below 1 mm. Through these holes 13 flows air from the base into the main air stream and

reduces such slightly the flow resistance of the inhaler. The actual diameter of these holes 13 can be chosen by proper inserts in the tools so that the mean flow resistance can be made equal to the target value.

- 5 Accordingly, in a preferred embodiment the invention relates to a method for the administration of an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , by means of the inhaler according to figure 1, comprising
- 10 a housing, containing two windows, a deck in which there are air inlet ports and which is provided with a screen secured via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened pins and movable counter to a spring, a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut,
- 15 and three holes with diameters below 1 mm in the central region around the capsule chamber and underneath the screen housing and screen.

- In another embodiment, the invention relates to a method for treatment of airway diseases, particularly COPD (chronic obstructive pulmonary disease) and asthma,
- 20 characterized in that an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , is administered via inhalation by the inhaler according to figure 1, comprising
- a housing, containing two windows, a deck in which there are air inlet ports and
- 25 which is provided with a screen secured via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened pins and movable counter to a spring, a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut,
- and three holes with diameters below 1 mm in the central region around the capsule
- 30 chamber and underneath the screen housing and screen.

- In another preferred embodiment the invention relates to the use of the inhaler according to figure 1, comprising a housing, containing two windows,
- a deck in which there are air inlet ports and which is provided with a screen secured
- 35 via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened pins and movable counter to a spring; a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut, and three holes with diameters below 1 mm in

the central region around the capsule chamber and underneath the screen housing and screen,

for the administration of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient
5 with an average particle size of between 10 to 500 μm .

In yet another preferred embodiment the invention relates to an inhalation kit consisting of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an
10 average particle size of between 10 to 500 μm , and the inhaler according to figure 1, comprising

a housing, containing two windows, a deck in which there are air inlet ports and which is provided with a screen secured via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened
15 pins and movable counter to a spring, a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut, and three holes with diameters below 1 mm in the central region around the capsule chamber and underneath the screen housing and screen.

20 In another preferred embodiment according to the invention the inhaler according to US 4,524,769 is applied. This inhaler (or inhalator) is activated by the air flow generated at inhalation. The disclosure of US 4,524,769 is incorporated herein by reference in its entirety.

25 Accordingly, in a preferred embodiment the invention relates to a method for the administration of an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , by means of the inhaler according to US 4,524,769, comprising a nozzle, a conduit connected to the nozzle,

30 a storage chamber adjacent said conduit for storing said inhalable powder to be dispensed by said inhalator, a perforated membrane having a plurality of preselected perforated portions each holding and dispensing a reproducible unit dose of less than 50 mg of the said inhalable powder, said membrane being mounted for movement between said conduit and said storage chamber so that one of said
35 preselected portions is positioned across said conduit whereby the active compound held in the perforation thereof can be dispensed into the conduit and another of said preselected portions thereof is disposed within said storage chamber, dose loading means for introducing said inhalable powder in the storage chamber into the perforation of the preselected portion of said membrane disposed within the

storage chamber, and maneuvering means for displacing the perforated membrane through a plurality of positions whereby successive preselected portions of the perforated membrane holding the inhalable powder are positioned across said conduit for dispensing the inhalable powder.

5

In another embodiment, the invention relates to a method for treatment of airway diseases, particularly COPD (chronic obstructive pulmonary disease) and asthma, characterized in that an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with
10 an average particle size of between 10 to 500 μm , is administered via inhalation by the inhaler according to US 4,524,769, comprising
a nozzle, a conduit connected to the nozzle, a storage chamber adjacent said conduit for storing said inhalable powder to be dispensed by said inhalator,
a perforated membrane having a plurality of preselected perforated portions each
15 holding and dispensing a reproducible unit dose of less than 50 mg of the said inhalable powder, said membrane being mounted for movement between said conduit and said storage chamber so that one of said preselected portions is positioned across said conduit whereby the active compound held in the perforation thereof can be dispensed into the conduit and another of said preselected portions
20 thereof is disposed within said storage chamber, dose loading means for introducing said inhalable powder in the storage chamber into the perforation of the preselected portion of said membrane disposed within the storage chamber, and
maneuvering means for displacing the perforated membrane through a plurality of positions whereby successive preselected portions of the perforated membrane
25 holding the inhalable powder are positioned across said conduit for dispensing the inhalable powder.

In another preferred embodiment the invention relates to the use of the inhaler according to US 4,524,769 comprising
30 a nozzle, a conduit connected to the nozzle, a storage chamber adjacent said conduit for storing said inhalable powder to be dispensed by said inhalator,
a perforated membrane having a plurality of preselected perforated portions each holding and dispensing a reproducible unit dose of less than 50 mg of the said inhalable powder, said membrane being mounted for movement between said conduit
35 and said storage chamber so that one of said preselected portions is positioned across said conduit whereby the active compound held in the perforation thereof can be dispensed into the conduit and another of said preselected portions thereof is disposed within said storage chamber, dose loading means for introducing said inhalable powder in the storage chamber into the perforation of the preselected

portion of said membrane disposed within the storage chamber, and maneuvering means for displacing the perforated membrane through a plurality of positions whereby successive preselected portions of the perforated membrane holding the inhalable powder are positioned across said conduit for dispensing the inhalable powder,

for the administration of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm .

10 In yet another preferred embodiment the invention relates to an inhalation kit consisting of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , and the inhaler according to US 4,524,769, comprising

15 a nozzle, a conduit connected to the nozzle, a storage chamber adjacent said conduit for storing said inhalable powder to be dispensed by said inhalator, a perforated membrane having a plurality of preselected perforated portions each holding and dispensing a reproducible unit dose of less than 50 mg of the said inhalable powder, said membrane being mounted for movement between said conduit

20 and said storage chamber so that one of said preselected portions is positioned across said conduit whereby the active compound held in the perforation thereof can be dispensed into the conduit and another of said preselected portions thereof is disposed within said storage chamber, dose loading means for introducing said inhalable powder in the storage chamber into the perforation of the preselected

25 portion of said membrane disposed within the storage chamber, and maneuvering means for displacing the perforated membrane through a plurality of positions whereby successive preselected portions of the perforated membrane holding the inhalable powder are positioned across said conduit for dispensing the inhalable powder.

30

In another preferred embodiment according to the invention the inhaler according to US 5,590,645 is applied. The disclosure of US 5,590,645 is incorporated herein by reference in its entirety.

35

Accordingly, in a preferred embodiment the invention relates to a method for the administration of an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , by means of the inhaler according to 5,590,645, comprising

a medicament pack having a plurality of containers for containing medicament in powder form wherein the containers are spaced along the length of and defined between two peelable sheets secured to each other, an opening station for receiving a container of said medicament pack being, means positioned to engage peelable
5 sheets of a container which has been received in said opening station for peeling apart the peelable sheets, to open such a container, an outlet, positioned to be in communication with an opened container, through which a user can inhale medicament in powder form from such an opened container, and
10 indexing means for indexing in communication with said outlet containers of a medicament pack in use with said inhalation device.

In another embodiment, the invention relates to a method for treatment of airway diseases, particularly COPD (chronic obstructive pulmonary disease) and asthma, characterized in that an inhalable powder containing tiotropium, preferably in an
15 amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , is administered via inhalation by the inhaler according to US 5,590,645, comprising
a medicament pack having a plurality of containers for containing medicament in powder form wherein the containers are spaced along the length of and defined
20 between two peelable sheets secured to each other, an opening station for receiving a container of said medicament pack being, means positioned to engage peelable sheets of a container which has been received in said opening station for peeling apart the peelable sheets, to open such a container, an outlet, positioned to be in communication with an opened container, through which a user can inhale
25 medicament in powder form from such an opened container, and
indexing means for indexing in communication with said outlet containers of a medicament pack in use with said inhalation device.

In another preferred embodiment the invention relates to the use of the inhaler
30 according to US 5,590,645, comprising
a medicament pack having a plurality of containers for containing medicament in powder form wherein the containers are spaced along the length of and defined between two peelable sheets secured to each other, an opening station for receiving
a container of said medicament pack being, means positioned to engage peelable
35 sheets of a container which has been received in said opening station for peeling apart the peelable sheets, to open such a container, an outlet, positioned to be in communication with an opened container, through which a user can inhale medicament in powder form from such an opened container, and

indexing means for indexing in communication with said outlet containers of a medicament pack in use with said inhalation device,
for the administration of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient
5 with an average particle size of between 10 to 500 μm .

In yet another preferred embodiment the invention relates to an inhalation kit consisting of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an
10 average particle size of between 10 to 500 μm , and the inhaler according to US 5,590,645, comprising
a medicament pack having a plurality of containers for containing medicament in powder form wherein the containers are spaced along the length of and defined between two peelable sheets secured to each other, an opening station for receiving
15 a container of said medicament pack being, means positioned to engage peelable sheets of a container which has been received in said opening station for peeling apart the peelable sheets, to open such a container, an outlet, positioned to be in communication with an opened container, through which a user can inhale medicament in powder form from such an opened container, and
20 indexing means for indexing in communication with said outlet containers of a medicament pack in use with said inhalation device.

In another preferred embodiment according to the invention the inhaler according to US 4,627,432 is applied. The disclosure of US 4,627,432 is incorporated herein by
25 reference in its entirety.

Accordingly, in a preferred embodiment the invention relates to a method for the administration of an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an
30 average particle size of between 10 to 500 μm , by means of the inhaler according to US 4,627,432, being characterised by a housing with a chamber therein, an air inlet into the chamber,
a circular disc having an axis substantially coaxial to the chamber axis and rotatable inside the chamber and provided with a plurality of apertures therethrough arranged
35 in a circle, said apertures being sized and positioned so that each aperture is adapted to be aligned with a different container, the said disc being arranged so that the carrier can be placed in contact with one face of the disc with one of the containers located in each one of the apertures, an outlet through which a patient may inhale leading out of the chamber, an opening in said housing alignable with

respective ones of the apertures in the disc as the disc is rotated, a plunger operatively connected to said housing and having a penetrating member, said penetrating member being displaceable to pass through said opening and the corresponding aperture in the disc registered with it thereby to penetrate and open a container located in the aperture so that the medicament will be released from the container and entrained in the air flow produced by a patient inhaling through the outlet, and means between said disc and said housing for rotatably indexing the disc to register each of the apertures in turn with the housing opening.

10 In another embodiment, the invention relates to a method for treatment of airway diseases, particularly COPD (chronic obstructive pulmonary disease) and asthma, characterized in that an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , is administered via inhalation by the inhaler according to US 4,627,432, being characterised by a housing with a chamber therein, an air inlet into the chamber, a circular disc having an axis substantially coaxial to the chamber axis and rotatable inside the chamber and provided with a plurality of apertures therethrough arranged in a circle, said apertures being sized and positioned so that each aperture is adapted to be aligned with a different container, the said disc being arranged so that the carrier can be placed in contact with one face of the disc with one of the containers located in each one of the apertures, an outlet through which a patient may inhale leading out of the chamber, an opening in said housing alignable with respective ones of the apertures in the disc as the disc is rotated, a plunger operatively connected to said housing and having a penetrating member, said penetrating member being displaceable to pass through said opening and the corresponding aperture in the disc registered with it thereby to penetrate and open a container located in the aperture so that the medicament will be released from the container and entrained in the air flow produced by a patient inhaling through the outlet, and means between said disc and said housing for rotatably indexing the disc to register each of the apertures in turn with the housing opening.

In another preferred embodiment the invention relates to the use of the inhaler according to US 4,627,432 being characterised by a housing with a chamber therein, an air inlet into the chamber, a circular disc having an axis substantially coaxial to the chamber axis and rotatable inside the chamber and provided with a plurality of apertures therethrough arranged in a circle, said apertures being sized and positioned so that each aperture is adapted to be aligned with a different container, the said disc being arranged so that

the carrier can be placed in contact with one face of the disc with one of the containers located in each one of the apertures, an outlet through which a patient may inhale leading out of the chamber, an opening in said housing alignable with respective ones of the apertures in the disc as the disc is rotated, a plunger
5 operatively connected to said housing and having a penetrating member, said penetrating member being displaceable to pass through said opening and the corresponding aperture in the disc registered with it thereby to penetrate and open a container located in the aperture so that the medicament will be released from the container and entrained in the air flow produced by a patient inhaling through the
10 outlet, and means between said disc and said housing for rotatably indexing the disc to register each of the apertures in turn with the housing opening, for the administration of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm .

15 In yet another preferred embodiment the invention relates to an inhalation kit consisting of an inhalable powdered containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , and the inhaler according to US
20 4,627,432, being characterised by a housing with a chamber therein, an air inlet into the chamber, a circular disc having an axis substantially coaxial to the chamber axis and rotatable inside the chamber and provided with a plurality of apertures therethrough arranged in a circle, said apertures being sized and positioned so that each aperture is
25 adapted to be aligned with a different container, the said disc being arranged so that the carrier can be placed in contact with one face of the disc with one of the containers located in each one of the apertures, an outlet through which a patient may inhale leading out of the chamber, an opening in said housing alignable with respective ones of the apertures in the disc as the disc is rotated, a plunger
30 operatively connected to said housing and having a penetrating member, said penetrating member being displaceable to pass through said opening and the corresponding aperture in the disc registered with it thereby to penetrate and open a container located in the aperture so that the medicament will be released from the container and entrained in the air flow produced by a patient inhaling through the
35 outlet, and means between said disc and said housing for rotatably indexing the disc to register each of the apertures in turn with the housing opening.

The following Examples serve to illustrate the present invention further without restricting its scope to the embodiments provided hereinafter by way of example.

Starting materials

As a starting material for the synthesis of crystalline tiotropiumbromide monohydrate tiotropiumbromide obtained according to the disclosure of European patent
5 application EP 418 716 A1 is be used.

Preparation of crystalline tiotropium bromide monohydrate:

15.0 kg of tiotropium bromide as obtained according to the methods disclosed in EP
418 716 A1 are added to 25.7 kg of water in a suitable reaction vessel. The mixture
10 is heated to 80-90°C and stirred at constant temperature until a clear solution is
formed. Activated charcoal (0.8 kg), moistened with water, is suspended in 4.4 kg of
water, this mixture is added to the solution containing the tiotropium bromide and
rinsed with 4.3 kg of water. The mixture thus obtained is stirred for at least 15 min at
80-90°C and then filtered through a heated filter into an apparatus which has been
15 preheated to an outer temperature of 70°C . The filter is rinsed with 8.6 kg of water.
The contents of the apparatus are cooled at 3-5°C every 20 minutes to a
temperature of 20-25°C. The apparatus is further cooled to 10-15°C using cold water
and crystallisation is completed by stirring for at least one hour. The crystals are
isolated using a suction drier, the crystal slurry isolated is washed with 9 litres of cold
20 water (10-15°C) and cold acetone (10-15°C). The crystals obtained are dried in a
nitrogen current at 25°C over 2 hours.

Yield : 13.4 kg of tiotropium bromide monohydrate (86 % of theory)

The crystalline tiotropium bromide monohydrate thus obtained is micronised by
25 known methods, to bring the active substance into the average particle size which
meets the specifications according to the invention.

The DSC diagram of crystalline tiotropium bromide monohydrate shows two
characteristic signals. The first, relatively broad, endothermic signal between 50-
30 120°C can be attributed to the dehydration of the tiotropium bromide monohydrate to
produce the anhydrous form. The second, relatively sharp endothermic peak at 230
± 5°C can be put down to the melting of the substance. These data were obtained
using a Mettler DSC 821 and evaluated with the Mettler STAR software package.
These data, like the other values given in the above Table, were obtained at a
35 heating rate of 10 K/min.

The crystalline tiotropium bromide monohydrate thus obtained was characterised by
IR spectroscopy. The data was obtained using a Nicolet FTIR spectrometer and

evaluated with the Nicolet OMNIC software package, version 3.1. The measurement was carried out with 2.5 μ mol of tiotropium bromide monohydrate in 300 mg of KBr. Table 1 shows some of the essential bands of the IR spectrum.

5 Table 1: Attribution of specific bands

Wave number (cm ⁻¹)	Attribution	Type of oscillation
3570, 410	O-H	elongated oscillation
3105	Aryl C-H	elongated oscillation
1730	C=O	elongated oscillation
1260	Epoxide C-O	elongated oscillation
1035	Ester C-OC	elongated oscillation
720	Thiophene	cyclic oscillation

The crystalline tiotropium bromide monohydrate was characterised by X-ray structural analysis. The measurements of X-ray diffraction intensity were carried out
 10 on an AFC7R- 4-circuit diffractometer (Rigaku) using monochromatic copper K α radiation. The structural solution and refinement of the crystal structure were obtained by direct methods (SHELXS86 Program) and FMLQ-refinement (TeXsan Program). The X-ray structural analysis carried out showed that crystalline tiotropium bromide hydrate has a simple monoclinic cell with the following dimensions:
 15 $a = 18.0774 \text{ \AA}$, $b = 11.9711 \text{ \AA}$, $c = 9.9321 \text{ \AA}$, $\beta = 102.691^\circ$, $V = 2096.96 \text{ \AA}^3$.

Apparatus

The following machines and equipment, for example, may be used to prepare the
 20 inhalable powders according to the invention:

Mixing container or powder mixer: Gyrowheel mixer 200 L; type: DFW80N-4; made by: Messrs Engelsmann, D-67059 Ludwigshafen.

25 Granulating sieve: Quadro Comil; type: 197-S; made by: Messrs Joisten & Kettenbaum, D-51429 Bergisch-Gladbach.

The following examples provide for inhalable powder mixtures applicable according to the invention.

Example 1:

- 5 5.2 kg of glucose monohydrate for inhalation (average particle size 25µm) are used as the excipient. 22.5 g crystalline tiotropiumbromide monohydrate (micronised; average particle size 1 - 3.5 µm) are used as the active ingredient.

10 The aforementioned components are sieved in alternate layers of lactose monohydrate in batches of about 200 g and crystalline tiotropiumbromide monohydrate in batches of about 1g. The ingredients sieved in are then mixed together (mixing at 900 rpm).

15 According to the invention preferably 5.2225 mg of the aforementioned powder are delivered per dose.

Example 2:

- 20 5.4775 kg of lactose monohydrate for inhalation (average particle size 25µm) are used as the excipient. 22.5 g crystalline tiotropiumbromide monohydrate (micronised; average particle size 1 - 3.5 µm) are used as the active ingredient.

The aforementioned components are sieved in alternate layers of lactose monohydrate in batches of about 200 g and crystalline tiotropiumbromide monohydrate in batches of about 1g. The ingredients sieved in are then mixed
25 together (mixing at 900 rpm).

According to the invention preferably 5.5 mg of the aforementioned powder are delivered per dose.

30 **Example 3:**

1.1: Excipient mixture:

- 5.203 kg of lactose monohydrate for inhalation (average particle size 25 µm) are used as the coarser excipient component. 0,27 kg of lactose monohydrate (5µm) are used as the finer excipient component. In the resulting 5,473 kg of excipient mixture
35 the proportion of the finer excipient component is 5%.

The aforementioned components are sieved in alternate layers of lactose monohydrate (25 µm) in batches of about 200 g and lactose monohydrate (5 µm) in

batches of about 10g. The ingredients sieved in are then mixed together (mixing at 900 rpm).

1.2: Final mixture:

- 5 To prepare the final mixture, 5,473 kg of the excipient mixture (1.1) and 22.5 g crystalline tiotropiumbromide monohydrate (micronised; average particle size 1 - 3.5 μm) are used. The content of active substance in the resulting powder is 0.4%.

- 10 The aforementioned components are sieved in in alternate layers of excipient mixture (1.1) in batches of about 200 g and crystalline tiotropiumbromide monohydrate in batches of about 1g. The ingredients sieved in are then mixed together (mixing at 900 rpm).

- 15 According to the invention preferably about 5.5 mg of the aforementioned powder are delivered per dose.

Patent Claims

- 1) Use of an inhaler for the administration of a tiotropium containing inhalable powder via inhalation, characterised in that the inhalable powder contains
5 tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm , and further characterized in that the said inhaler displays a flow resistance of about $0.01 - 0.1 \sqrt{kPa} \text{ min/l}$.
- 10 2) Use according to claim 1, characterised in that the inhaler is characterized by a flow resistance of about $0.02 - 0.06 \sqrt{kPa} \text{ min/l}$.
- 3) Use according to claim 1 or 2, characterised in that the inhaler comprises a housing, containing two windows, a deck in which there are air inlet ports and
15 which is provided with a screen secured via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened pins and movable counter to a spring, a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut, and three holes with diameters below 1 mm in the central
20 region around the capsule chamber and underneath the screen housing and screen.
- 4) Use according to one of claims 1, 2 or 3, characterised in that tiotropium is used in form of its chloride, bromide, iodide, methanesulphonate, para-
25 toluenesulphonate or methyl sulphate, preferably in form of its bromide.
- 5) Use according to claim 4, characterised in that tiotropium is used in form of its crystalline tiotropium bromide monohydrate.
- 30 6) Inhalation kit consisting of an inhaler displaying a flow resistance of about $0.01 - 0.1 \sqrt{kPa} \text{ min/l}$ and an inhalable powder containing tiotropium, preferably in an amount of 0.001 to 5 %, in admixture with a physiologically acceptable excipient with an average particle size of between 10 to 500 μm .
- 35 7) Inhalation kit according to claim 6, characterised in that the inhaler is characterized by a flow resistance of about $0.02 - 0.06 \sqrt{kPa} \text{ min/l}$.

- 8) Inhalation kit according to claim 6 or 7, characterised in that the inhaler comprises a housing, containing two windows, a deck in which there are air inlet ports and which is provided with a screen secured via a screen housing, an inhalation chamber connected to the deck on which there is a push button provided with two sharpened pins and movable counter to a spring, a mouthpiece which is connected to the housing, the deck and a cover via a spindle to enable it to be flipped open or shut, and three holes with diameters below 1 mm in the central region around the capsule chamber and underneath the screen housing and screen.
- 9) Inhalation kit according to one of claims 6, 7 or 8, characterised in that tiotropium is present in form of its chloride, bromide, iodide, methanesulphonate, para-toluenesulphonate or methyl sulphate, preferably in form of its bromide.
- 10) Inhalation kit according to claim 9, characterised in that tiotropium is present in form of its crystalline tiotropium bromide monohydrate.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/EP 03/03431

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: —
because they relate to subject matter not required to be searched by this Authority, namely:
Rule 39.1(iv) PCT – Method for treatment of the human or animal body by therapy
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
